
[done] multiple question validation work around

Posted by sdelaney - 2008/07/03 19:01

Does the multiple question validation work around listed here work with 1.71+ build 5203?

I tried the example listed here,

http://docs.limesurvey.org/tiki-index.php?page=Workarounds#Multiple_Question_Validation

but after I save the question the and tags disappear.

You will have to deactivate the XSS filter in config.php to be able to use javascript.

That was fast!

If I deactivate the filter, does that make my site very vulnerable to exploit?

In general the filter was implemented to improve security. Depending on your question types this doesn't have to be a security risk as long as the user hasn't got the opportunity to enter text.

Nevertheless switching this filter off doesn't make your system vulnerable in general.
