
[done] help with assessment statistic

Posted by erickson - 2008/07/25 04:13

hi, am using 1.71+ build 5048
well everything is working fine with jpgraph installed.

my assessment is divided into groups(A,B,C)with let's say 10 questions each. I want to be able to retrieved statistics(%) for individual user (after having defined the answers in the statistic window) in relation to their answers within each groups.

what am only able to do now, is to get statics for each answer instead of each user

thx

Sorry, this isn't possible yet.

You can only filter data by ID to check the answer of a certain participant.

Can't that type of analysis be done by Excel/OpenOffice Calc/stat program/spreadsheet program of your choice? Some of the data I have for one of my surveys will be sorted by user as well as by question.

It depends on your survey settings. When using restricted access and the survey is non-anonymous the participants data and the answers are linked using the token which can be found in the tokens table and in the survey table. This way you can merge this data.

Regarding assessments I don't see a way to merge user and answer data because the assessment rules are stored in a different table.
